

environmental services

When it comes to environmental services, H2M is accustomed to tackling anything from residential petroleum storage tanks to the most severe environmental catastrophes. Supporting the legal and insurance industries, H2M has provided a wide range of site investigation, remediation and project management related services. Our engineers, hydrogeologists, geologists, and environmental consultants are:

- Cognizant of local, state, and federal regulations.
- Experts in their respective fields, many of which have testified in state and federal courts.

We're in the business of meeting challenges, preserving the environment, and protecting our communities. We turn brownfields into playing fields, delineate and investigate chemically impacted sites, and assist in driving down remedial costs. Whether we are conducting monthly sampling, completing a due diligence evaluation, or designing a chemical storage tank, our responsive and dedicated team will make your environment work.

Our investigators search for key evidence to determine the cause and origin of the incident, identify the responsible parties, and evaluate the potential for subrogation and cost recovery.
